Art Unit: 2171

DETAILED ACTION

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

1. Claims 2, 3, 16, and 17 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for a 'green light icon' that is displayed if a node is acyclic and stable (see para. 74 of the instant specification), does not reasonably provide enablement for a valid type dependency. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make or use the invention commensurate in scope with these claims.

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

- 2. Claims 1-28 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
- 3. Referring to claims 1 and 15, the claims recite the limitation "the terms associated with other lexical nodes" in lines 8 and 2-3 respectively. There is insufficient antecedent basis for these limitations in the claims.

Art Unit: 2171

4. Referring to claims 2, 3, 16, and 17, the claims recite the limitation "a valid type dependency", however it is unclear as to how a valid type dependency is ascertained. In the interest of compact prosecution, Examiner will assume that a valid type dependency is ascertained when a node is acyclic and stable as indicated by a green light symbol (see para. 74 of the instant specification).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors

Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology

Technical Amendments Act of 2002 do not apply when the reference is a U.S.

patent resulting directly or indirectly from an international application filed before

November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

- 5. Claims 1-3, 13-17, 27, and 28 are rejected under 35 U.S.C. 102(e) as being anticipated by US Patent Number 6,446,081 B1 issued to Preston.
- 6. Referring to claims 1 and 15, Preston discloses:

Art Unit: 2171

A computer method and system for viewing a data dictionary structure (Abstract), the system comprising a processor (Abstract) comprising:

- a first component configured to retrieve a data dictionary ('stored lexical table', col. 2, lines 57-61; 'lexical database', col. 10, lines 20-24, Fig. 9a, element 234; access of lexical database, Fig. 15b, element 724) including terms ('dictionary entries', col. 3, lines 5-14; 'object', col. 7, lines 1-7; col. 7, lines 21-24, Fig. 7, elements 510, 520) and term definitions ('meaning', col. 3, lines 5-14; 'meaning' field, col. 7, lines 21-25; Fig. 7, elements 514, 524);
- a second component configured to determine all lexical nodes of the data dictionary based on the terms (col. 8, lines 27-43;
 locate objects of lexical database, Fig. 15b, element 726);
- a third component configured to parse each term's definition
 (Abstract; col. 8, lines 44-47; Fig. 8, element 610);
- a fourth component configured to determine dependencies of each lexical node based on the parsed definitions and the terms associated with the other lexical nodes ('pointer data' indicates semantic dependencies, col. 7, lines 1-10; 'pointer fields'¹, col. 7, lines 21-32, 'linked from', 'linked to', Fig. 7, elements 518, 519, 528, 529; col. 9, lines 27-37; Fig. 14, elements 662, 664);

¹ The interconnection between objects is derived by the pointer fields thereby allowing the determination of dependencies of each lexical node.

Art Unit: 2171

a fifth component configured to generate a lexical graph (Fig. 11a-b) based on the determined lexical nodes and the determined dependencies (Abstract; 'display control data' generated, col. 7, lines 1-10); and

- a display coupled to the processor and configured to display at least a portion of the generated lexical graph (Abstract; col. 1, lines 63-67; col. 7, lines 31-50, Fig. 5b; col. 9, lines 37-42; col. 10, lines 36-51 and 58-64, Fig. 11a-b; col. 10, line 65-col. 11, line 3, Fig. 13; 'semantic dictionary', Fig. 24b).
 - 7. Referring to claims 2 and 16, Preston discloses that the determined dependencies comprise at least one of a valid type dependency, a caution type dependency, or a cyclical type dependency (col. 18, lines 44-52)².
 - 8. Referring to claims 3 and 17, Preston discloses generating node icons based on the dependency type ('codes' indicating the level of difficulty, complexity or obscurity of each entry in the lexical table, col. 11, lines 31-40)³.
 - 9. Referring to claims 13 and 27, Preston discloses modifying at least one definition associated with the terms of one or more lexical nodes, parsing the at least one modified definition, redetermining dependencies of each lexical node based on the previous parsed definition, parsed modified definition, and the terms associated with the other lexical nodes, and regenerating the

² In this citation Preston discloses a cyclical dependency (as defined in para. 21 of the instant specification) where a determination of a sequence is made wherein event A is expected to cause event B but B is expected to cause A.

³ Referring to para. 21 of the instant specification, an icon is defined as a status symbol. Examiner respectfully asserts that a code for each entry in the lexical table is a status symbol.

Art Unit: 2171

lexical graph based on the redetermined dependencies (col. 8, line 44- col. 9, line 7; col. 10, line 65 – col. 11, line 19; col. 16, lines 20-30).

10. Referring to claims 14 and 28, Preston discloses adding a lexical node by inserting a term and term definition; parsing the term definition of the added lexical node; redetermining dependencies based on the previous parsed definitions, the parsed definition of the added lexical node, and the terms associated with the other lexical nodes; and regenerating the lexical graph based on the redetermined dependencies (col. 8, line 44- col. 9, line 7; col. 10, line 65 – col. 11, line 19; col. 16, lines 20-30).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 11. Claims 4-7 and 18-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Preston as applied to claims 1 and 15 above, in view of 'A dynamic cluster maintenance system for information retrieval' by Can et al. (hereafter Can).
- 12. Referring to claims 4 and 18, Preston discloses all of the claimed subject matter as set forth above but fails to disclose:

Art Unit: 2171

determining a lexical stability value for each lexical node (claims 4 and
 18);

- displaying the determined lexical stability value with the associated
 lexical node in a lexical graph (claims 5 and 19);
- determining that the lexical stability value comprises dividing the
 number of nodes that lexically depend on a current node by the
 number of nodes that lexically depend on the current node plus the
 number of nodes that the current node lexically depends from (claims 6
 and 20); and
- determining an aggregate stability value (claims 7 and 21).

However, referring to claims 4-7 and 18-21, Can teaches analogous art wherein the following is taught:

- determining a lexical stability value for each lexical node (Abstract;
 pages 123-130)⁴ (claims 4 and 18);
- displaying the determined lexical stability value with the associated
 lexical node in a lexical graph (Fig. 1, 2, and 3) (claims 5 and 19);
- determining that the lexical stability value comprises dividing the number of nodes that lexically depend on a current node by the number of nodes that lexically depend on the current node plus the

⁴ A lexical stability value is determined for each document, *m*, in an index vocabulary database by a 'CC Based Cluster Maintenance' algorithm in order to assess stability or similarity characteristics of documents within the database.

Art Unit: 2171

number of nodes that the current node lexically depends from ('centroid entry', page 129, part 4.5 (b)) (claims 6 and 20); and

determining an aggregate stability value (Abstract; page 127, Section
 4.3 till part (e)) (claims 7 and 21).

It would have been obvious to a person of ordinary skill in the art at the time that the invention was made to modify Preston to further include determining and displaying a lexical stability value for each lexical node, furthermore determining that the lexical stability value comprises dividing the number of nodes that lexically depend on a current node by the number of nodes that lexically depend on the current node plus the number of nodes that the current node lexically depends from, and determining an aggregate stability value as taught by Can.

The ordinary skilled artisan would have been motivated to modify Preston per the above for the purpose of judging the effectiveness of a cluster maintenance scheme, that is, for the purpose of enabling new additions to be made into a cluster, while not causing noticeable changes to be made in the original cluster. Additional motivation includes the ability of the clustering strategy of Can to handle dynamic cluster maintenance efficiently and effectively (see page 126, Section 4; Conclusion, Section 5).

13. Claims 8-12, and 22-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Preston in view of Can as applied to claims 4, 7, 18, and 21

Art Unit: 2171

above, and further in view of US Patent Number 6,263, 334 B1 issued to Fayyad et al (hereafter Fayyad).

- 14. Referring to claims 8-12, and 22-26, Preston/Can discloses all of the claimed subject matter as set forth above, however the combination of Preston/Can fails to disclose:
 - displaying an aggregate stability value (claims 8 and 22);
 - determining that the aggregate stability value of a current node
 comprises adding the lexical stability values of all nodes that are
 lexically dependent upon the current node to the current node's lexical
 stability value (claims 9 and 23);
 - determining a global stability value by summing lexical stability values
 of all nodes (claims 10 and 24);
 - determining a fractional stability value for each node based on the aggregate and global stability values (claims 10 and 24);
 - displaying the determined fractional stability value for each node
 (claims 11 and 25); and
 - determining that the fractional stability for a current node comprises dividing the current node's aggregate stability value by the global stability value (claims 12 and 26).

However, referring to claims 8-12, and 22-26, Fayyad teaches analogous art wherein the following is taught:

Art Unit: 2171

displaying aggregate stability values (or probability density values, h1 and h2) (col. 6, lines 10-27; Fig. 5) (claims 8 and 22);

- determining that the aggregate stability value of a current node
 comprises adding the lexical stability values of all nodes that are
 lexically dependent upon the current node to the current node's lexical
 stability value ('probability density function (pdf)', col. 9, line 14- col. 10,
 line 23) (claims 9 and 23);
- determining a global stability value by summing lexical stability values
 of all nodes (h1+h2+Hrest, where 'Hrest is the sum of the heights of
 the curves for all other clusters' (Gaussians G1, G2 and G3), col. 6,
 lines 10-40; Fig. 5) (claims 10 and 24);
- determining a fractional stability value (or a 'weighting factor' of the membership of a data point X to clusters G1 and G2, col. 6, lines 10-40, Fig. 5) for each node based on the aggregate and global stability values (claims 10 and 24);
- displaying the determined fractional stability value for each node (See Fig. 5 with regard to the distance between data point X, X1 and X2;
 col. 6. lines 17-40)⁵ (claims 11 and 25); and
- determining that the fractional stability for a current node comprises dividing the current node's aggregate stability value by the global stability value (Refer to discussion of claims 10 and 24 above; the

⁵ The distances from data point X to the other points X1 and X2 indicate the fractions of X that belong to cluster G1 and cluster G2 (0.8 and 0.2 respectively, as indicated in col. 6, lines 35-40).

Art Unit: 2171

weighting factor of h1 to cluster G1 is given by 'h1/h1+h2+hRest') (claims 12 and 26).

It would have been obvious to a person of ordinary skill in the art at the time that the invention was made to modify Preston/Can to further include displaying aggregate stability values, determining a global stability value, determining and displaying a fractional stability value for each node, and furthermore determining that the fractional stability for a current node comprises dividing the current node's aggregate stability value by the global stability value, as taught by Fayyad.

The ordinary skilled artisan would have been motivated to modify Preston/Can per the above for the purpose of using probability density to decide how data should be reorganized for efficient nearest neighbor queries (Abstract; col. 3, lines 2-5). Additional motivation would be to a clustered index structure and a statistical model of clustered data in a database in order to determine how data should be partitioned. The model can be used in order that data meets certain 'stability' conditions and that clusters do not overlap. These stability conditions are important because they enable a database design utility to decide whether the indexing method is likely to be useful for a given database (col. 3, lines 6-30).

Conclusion

15. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Art Unit: 2171

The following reference is cited with respect to measuring of stability of the clustering or classification of hierarchical data in a database:

'Techniques for measuring the stability of clustering: a comparative study', by Raghavan et al.
